Use of Manual Fly Section not Recommended on Rubber.

1. Chart based on 16.00 x 24 tires and 80 PSI inflation pressure. Loads must be reduced for lower inflation pressures.
2. *For 30,000 lb. lifting capacity, maximum boom length is 42 ft.

Capacities appearing above bold line are based upon structural strength and machine stability should not be relied upon as the capacity limitation.
** Indicates maximum capacity of Extended Fly Section, regardless of boom length.

NOTES TO LIFTING CAPACITIES, SEE REVERSE SIDE.

NOTES TO LIFTING CAPACITIES

- Rated lifting capacities, with fully extended outriggers, are the maximum loads covered by the manufacturer's warranty with the machine standing on a firm, level and uniform supporting surface. Capacities do not exceed 85% of tipping load. Do not exceed rated lifting capacities.
- For clamshell or concrete bucket operation, weight of bucket and load must not exceed 90% of rated lifting capacities.
- Jibs may be used for single line lifting crane service only. Jib capacities are based on structural strength of jib or main boom. Actual loads lifted must not exceed net lifting capacities for the actual operating radius.
- Long cantilever booms can create a tipping condition when in extended and lowered position.
- Each power-telescoping boom section should be extended equally at all times and boom length should not exceed any length restrictions shown on rated lifting capacity chart.
- The maximum load which may be telescoped is limited by hydraulic pressure, boom angle, boom lubrication, etc. It is safe to attempt to telescope any load within the limits of the rated lifting capacity chart.
- Single Line Capacity 6,790 lbs. (Maximum). For multiple part reeving, use one part of line for each 6,000 lbs. of load to be lifted.
